

Accelerating the installation of solar PV and battery storage in East Preston and Angmering

12th March 2024

Alex Templeton

07814 477378 | alex.templeton@communityinfrastructure.co.uk

What is stopping us?

A range of barriers prevent rapid adoption.

These include:

- 1) Cost
- 2) Slow rates of return on investment
- 3) Lack of understanding of technologies
- 4) Distrust of suppliers
- 5) A lack of data and information.

The purpose of Community Energy Service Companies (C-ESCOs)

Aim: To make it as simple and easy as possible for anyone - household or organisation
- to adopt renewable energy and battery storage

Key roles

- 1) To aggregate household and business projects in communities to achieve economies of scale and reduce finance costs
- 2) To offer households and businesses a 'Pay as you use' option

How this works

1. Conduct a geospatial survey of the area to identify potential energy projects
2. Build a list of those interested
3. Use this list to raise finance for project development
4. Conduct detailed feasibility study (including non-contractual expressions of interest from households)
5. Procurement, installation, commissioning, and operation
6. At this point:
 - a) Households that want buy the PV array purchase it
 - b) Households that cannot afford or do not want to purchase the PV array enter into a 'Pay as you Use' agreement
7. Scope for additional households to join later

What will this mean?

If you buy the PV:

- Reduced carbon emissions (0.19 kg CO₂e per kWh)
- Reduced cost of electricity (10-25% from the energy generated from the array)
- 7-15 years to pay for itself (working life: 30+ years)

'Pay as you use' option

- Reduced carbon emissions
- Reduced cost of electricity (10-25% from the energy generated from the array, assumes using a 'Time of Use' Tariff such as Economy 7)
- Regular options to buy the PV at residual value

What have we done so far?

1. Conducted a geospatial survey of Angmering

Total suitable buildings: 4,209

Potential power generation 17.95 MW

2. Secured support of West Sussex County Council

3. Secured funding from OFGEM and Innovate UK to develop elements of this model

The next six slides show:

- 1) High-level views of Angmering showing buildings assessed by the survey
- 2) A closer view of a cluster of buildings
- 3) Detailed data on an individual building
- 4) A list of the categories of data that the geospatial survey analyses and produces for each building

Attribute Name	Description
FID_Build	Unique Roof Identifier
X_COORD	Geographical Position in OSGB projection coordinate
Y_COORD	Geographical Position in OSGB projection coordinate
Address	Address as provided by Ordnance Survey
Postcode	Postcode as provided by Ordnance Survey
Class	Building class as provided by Ordnance Survey
ROOF_TYPE	Type of roof on a building, defined as either Sloped or Flat
SOLAR_SUIT	Is the roof suitable for a solar installation? If not, this field is left blank
Asp_mean	Mean direction of the roof aspect from north (0) in degrees
Asp_max	Maximum direction of the roof aspect from north (0) in degrees
Asp_min	Minimum direction of the roof aspect from north (0) in degrees
Slp_mean	Mean angle of the roof slope from horizontal (0) in degrees
Slp_max	Maximum angle of the roof slope from horizontal (0) in degrees
Slp_min	Minimum angle of the roof slope from horizontal (0) in degrees
AVG_IRRD	Estimated annual solar irradiation received by the building based on location and roof aspect & pitch (kWh/m2/Year)
SOLAR_AREA	Suitable area for solar panels in square metres
PANEL	Number of panels possible to fit to the measured roof space
SYSTEM_SIZ	Total system size based on number of panels and individual panel output (kWp)
YIELD	Estimated amount of productivity possible per roof(kWh) in the first year
SYSTEM_CST	Estimated price of panel installation per property (£)
EXP_REV_1Y	Estimated amount of income received from the electricity fed back into the grid over a one year (£)
EXP_REV_20	Estimated amount of income received from the electricity fed back into the grid over twenty-five years (£)
ELE_SAV_1Y	Estimated amount of money saved by using generated electricity on site over a one year (£)
ELE_SAV_20	Estimated amount of money saved by using generated electricity on site over twenty years (£)
CO2_SAV	Estimated amount of carbon emissions saved over a one-year period (kg/MWh)
CO2_SAV_20	Estimated amount of carbon emissions saved over a twenty-year period (kg/MWh)
TOTAL_BEN	Estimated amount of income received after deductions of system costs (£)
No_DSM	'Yes' if the building requiring analysis was not contained with the LiDAR data
Year	Indicates the year of capture of the LIDAR data used for the processing

Proceeding to the next stage: detailed analysis of a building

If you decide to participate, we will (as shown over the next 5 slides):

- 1) Model your roof
- 2) Assess shading from trees, and buildings
- 3) Assess the levels of light on the different parts of your roof
- 4) Come up with a design to maximise generation from your roof
- 5) If we have your energy bills, do a detailed calculation on the performance of the proposed system

Customer buys the PV/battery

- Provides good mix of price, quality and specification
- Scope for 'peer to peer' export of electricity, providing income and helping local energy users without PV
- Scope for extra income for grid services – especially where battery is included

Customer Funded option – projected benefits

Illustrative benefits for capital outlay of £8484. Projected not guaranteed benefits:

- Year 1 saving £1079, payback in 7-8 years, return on investment c13%

Key assumptions

- 4.05 kWp solar PV: £5,485 with a 5.2 kWh battery: £2,999
- Straightforward installation
- Ofgem Oct 23 price cap: 27.35p/kwh for imported electricity
- Energy prices rise with inflation – assumed long term at 3%
- Annual electricity use assumption 3121kWh
- Export of unused electricity at 10p/kWh (NB current SEG offers: 12p best unrestricted offer)
- Note: Also scope for further savings from Demand Flexibility Service

Pay As You Go option

- Expressions of interest now – needs scale
- Details being finalised over next few months.
- Target for start: Spring 2024
- Likely approach:
 - Electricity bill saving of around 10-25% on current assumptions.
- Pay As You Go option likely to be phased starting with solar PV.

Peer to Peer Trading potential

- What is peer to peer trading?
- Two levels: managed market and general market. Managed market brings bigger benefits but needs scale
- Managed market: need to bring together a large volume of generators (selling electricity) and consumers (buying electricity) – around 1,500-2,000 homes would need to participate as consumers.
- General market: small number of households can participate.
- Customer benefit illustration for a sample home in Essex: Annual cost of £786 giving a saving of £147 on a bill of £933. Assumes Ofgem typical consumption of 2700 kWh
- The saving comes from a very low standing charge 8.4p/day not from the volumetric charge. This can benefit any household, especially those with low consumption.

Expressing your interest

To express an interest in participating in the East Preston Community Energy scheme, contact:

Cllr. Alan Evans
